PERSONAL STATEMENT

Experienced software engineer with expertise in designing scalable, event-driven systems using .NET Core and Azure cloud technologies. Proficient in optimizing application performance and database efficiency, ensuring scalability, reliability, and high-performance data processing. Adept at leading agile development, mentoring junior developers, and building a collaborative team environment. A proactive communicator, ensuring seamless coordination between technical and non-technical stakeholders. Passionate about delivering high-quality, scalable solutions that drive business impact.

SKILLS

- Proficient in .NET Core 9 development with C#
- API Development with ASP .NET Core 9
- EF Core 9
- PostgreSQL
- Strong understanding of common development architecture & patterns (e.g. Domain Driven Design, SOLID)
- Infrastructure in Azure Cloud
- RESTful API Design
- API Connectors
- Azure Container Apps
- Azure DevOps
- TypeScript & AngularJs

EMPLOYMENT

CyberIAM | Chester, UK | [ConnectIAM.com](#)
.NET Developer | October 2020 – present (4.5 years)

Overview

I have been working on CyberIAM's greenfield project ConnectIAM since its inception in 2020. ConnectIAM is a cloud-native SaaS platform designed to unify and streamline the management of Identity and Access Management (IAM) infrastructure. It provides a single-pane-of-glass view over an organisation's security and identity infrastructure, integrating with systems such as Microsoft Azure & Entra ID, SailPoint IdentityNow, and CyberArk Privileged Cloud. The platform features interactive dashboards, real-time alerts, and actionable insights to help organisations monitor system health, identify security risks, and ensure compliance. I am responsible for designing, planning and delivering a high-performance, scalable back-end solution, powering internal tenant management tools, APIs that provide data for the customer-facing UI, and background tasks that process data from external connectors.

Key Achievements

- Advanced from Junior to Developer within three years, due to my strong technical expertise, enthusiasm, drive and evidenced leadership abilities.
- As part of the team, delivered an MVP for multiple international clients ranging from 10k-120k identities across various industries (financial services, healthcare and retail).
- Scaled our MVP to process IAM data from over 200k+ identities, discovering 20k+ security risks within our customer's identity infrastructure.

Technical Responsibilities

- Architected, developed, and maintained a suite of microservices-based RESTful APIs using ASP .NET Core 8, ensuring high-performance, scalable, and secure services.
- Designed and implemented an event-driven system with Azure Service Bus for efficient background task management, enabling smooth asynchronous communication and enhanced scalability. Focused on resilient eventual consistency across distributed services, ensuring integrity under heavy load.
- Database design using EF Core 8 and PostgreSQL, ensuring scalable and efficient data storage solutions. Due to the complexity of the system, designing optimised schemas and writing performant LINQ/SQL queries was crucial for handling large datasets efficiently. This work was essential for maintaining system responsiveness, supporting high-volume IAM data processing, and ensuring seamless integration with various microservices.
- Designed and implemented a robust connector framework, along with six REST API connectors, to integrate seamlessly with external identity and access management systems, including Microsoft (via Graph API), SailPoint IdentityNow, and CyberArk Privileged Cloud. These connectors process vast amounts of IAM data, including identities, entitlements, certification campaigns, and vulnerability assessments, ensuring secure and efficient data flow across systems.
- Maintain a deep understanding of integrated IAM systems to aid in designing new features, such as dashboards and alerts, ensuring effective monitoring and visibility of security risks.
- Responsible for the design and maintenance of multiple infrastructure deployments, including writing CI/CD pipelines and designing Azure cloud infrastructure using Azure's infrastructure as code platform (Bicep and ARM templates).
- Experience with Angular 17 and TypeScript, implementing front-end components based on UX/UI designs created in Figma. This experience has broadened my perspective as a back-end developer, allowing me to better understand front-end challenges, improve API design for seamless integration, and enhance collaboration with UI/UX designers and front-end engineers.

Leadership & Collaboration

- Mentoring junior and associate team members to increase productivity, output and the technical knowledge of the team as a whole. I provide guidance, pull request and code reviews, pair programming sessions, and technical support.
- Collaborate within an scrum-based agile development team focused on iterative delivery, working in short sprints to rapidly incorporate feedback from stakeholders and build this into future designs. This approach has enabled continuous improvement, adaptability to evolving requirements, and efficient prioritisation of development efforts to meet business objectives and timescales.
- I write concise and well-structured work items, primarily for the implementation of systems designed by me. This involves defining clear technical requirements, breaking down complex features into manageable tasks, and efficiently delegating work within the back-end team to ensure smooth execution, maintain high code quality and meet deadlines.
- Serving as a key point of contact between the development team and senior leadership, including the Product Owner and CTO. Proactively identifying and removing blockers to maintain development momentum while ensuring clear communication on project progress, technical challenges, and development priorities. Skilled in adapting discussions appropriately for both technical and non-technical audiences.

PERSONAL PROJECTS

In addition to my employment I enjoy developing B2B SaaS applications. My aspiration is to one day transform one of these projects into a small business that I can manage in my spare time. This passion has not only brought on my technical skills but also provided invaluable insights into end-to-end product design with me having to make 100% of the decisions and have to learn new elements of development at every hurdle.

FBA Analytics | [FBA-Analytics.tech](#)

FBA Analytics is my main personal project. It's an Excel add-in designed to provide Amazon sellers with tools to search wholesale price lists for profitable products directly within Excel. This addresses the issue with existing B2B SaaS solutions where users had to scan price lists on a web app and then transfer the data to Excel for further analysis.

Skills Acquired

- Product Approval (Excel Add-In Marketplace & Amazon Seller Marketplace)
 - Customer engagement
 - Authentication with Auth0
 - Payment processing with Stripe
 - Cost reduction and performance tuning (Amazon SP API has very strict rate limits)
 - Front-End design
 - Front-End development with React and Typescript
-

Automatic Invoice Scanner | [GitHub/DylanRiden/InvoiceAutoScan](#)

I developed a SaaS application designed to scan through users' Gmail accounts to identify and extract invoices, which could then be submitted directly to accounting software. This project aimed to simplify the invoicing process by automating the search and submission steps, reducing manual effort and errors. This project included direct connection to Gmail. Although this project is not currently in active development, the code is available on GitHub for reference.

Other Personal Projects

I believe that the best way to learn new technologies is to try something out with them. To that end, I have developed several small projects to explore new technologies and programming methods. These projects include work on the following technologies:

- AI (incorporating .Net's new Semantic Kernel)
- Different database types (no SQL and SQL)
- Internet of things
- Cryptocurrency & NFTs

EDUCATION

A Levels | Calday Grange Grammar School (Sep 2018 - Aug 2020)

- A* Computer Science
- A* Electronics
- A Mathematics

10 GCSEs | Calday Grange Grammar School (Sep 2013 - Aug 2018) Grades: 9-5
